Syllabus Alignment

Sub-topic	Official syllabus pointer (NTA official CUET(UG) 2026 syllabus — General Aptitude Test (501), the current 2027 baseline)	Skills the questions test
Analogies	Verbal and non-verbal reasoning: analogies	Naming the relationship between a pair and applying it to a new term.
Sequences	Verbal and non-verbal reasoning: sequences	Finding the hidden pattern in a series of numbers or letters.
Syllogisms	Verbal and non-verbal reasoning: syllogisms	Judging which conclusions MUST follow from given statements.
Coding-decoding	Verbal and non-verbal reasoning: coding-decoding	Cracking the rule that maps words to codes, then reapplying it.
Blood relations	Verbal and non-verbal reasoning: blood relations	Building a family tree from clues and reading relations correctly.
Direction sense	Verbal and non-verbal reasoning: direction sense	Tracking a path on a compass and measuring the final displacement.
Puzzles	Verbal and non-verbal reasoning: puzzles	Fixing positions or orders from a set of clues without contradiction.

OurMocks

EXAM PATTERN

CUET UG pattern (NTA official information bulletin and syllabus, 2026 cycle — the current 2027 baseline): each test paper carries **50 compulsory questions** in **60 minutes**, with +5 for every correct answer and −1 for every incorrect answer. The General Aptitude Test section named in the official syllabus is **Logical and Analytical Reasoning**: verbal and non-verbal reasoning spanning analogies, sequences, syllogisms, coding-decoding, blood relations, direction sense and puzzles. Reasoning questions are method questions — the seven families in this PDF each have one fixed routine that turns a puzzle into a procedure.

The One Skill Behind All Seven Families

Reasoning looks like seven different topics, but underneath runs a single skill: **refusing to guess, and instead drawing what the words describe**. The students who lose marks in reasoning are the ones who solve "in their head" — juggling relations, directions and patterns mentally until two options look equally right. The students who score solve on **paper**: a circle for a syllogism, a tree for a family, an arrow path for directions, a slot table for seating. Your pencil is faster and far more reliable than your working memory — use it every single time.

- **Every family has one fixed routine.** Learn the routine, not the answers — the same seven routines cover every reasoning question you will meet.
- **Draw first, conclude second.** A figure you can see beats an argument you can only feel.
- **Verify before marking.** A pattern must fit every term, a conclusion must hold in every diagram, a seating must satisfy every clue — "looks right" is not a check.
- **Speed comes from routine, not rushing.** A 30-second drawn answer beats a 2-minute mental wrestle, and it survives the −1 penalty because it is checked.
- **Practise by family, in blocks.** One evening per family, five questions in a row — pattern recognition grows by repetition within a family, not by mixing all seven at once.

REAL-WORLD ANALOGY

Solving reasoning in your head is like **assembling furniture without laying out the parts** — possible for two pieces, hopeless for ten. Drawing is laying out the parts: the Venn circles, the family tree, the arrow path, the slot table. Nothing is lost, every clue has a place, and the final picture either fits or shows exactly where it does not. Same brain, same facts — but organised on paper instead of balanced in memory.

Analogies: Name the Relationship First

An analogy question gives you a finished pair and an unfinished one: **Doctor : Hospital :: Teacher : ?** The question is not "what goes with teacher?" — it is "what RELATIONSHIP turns doctor into hospital, and what plays that same role for teacher?" Students who jump straight to guessing a partner for "teacher" fall for options that share the category but not the relationship. So the method begins with words, not options.

- **Step 1 — Read the pair aloud with a relationship sentence.** "A doctor WORKS AT a hospital." Say it in the simplest words possible.
- **Step 2 — Apply the SAME sentence to the third term.** "A teacher works at a…" — school. The sentence grammar forces the answer type.
- **Step 3 — Scan options for the relationship, not the category.** Both "school" and "student" belong to a teacher's world — but only school satisfies "works at".
- **Step 4 — Check the direction.** If the pair is worker : workplace, the answer must be a workplace — not a worker. Direction flips are a classic trap.
- **Relationships you will meet:** worker–workplace (doctor–hospital), tool–action (pen–write), young–adult (cub–lion), part–whole (wheel–car), cause–effect (virus–illness), degree (warm–hot).

SOLVED ANALOGIES — THREE FLAVOURS

Word analogy: Book : Read :: Food : ? — relationship sentence: "A book is meant to be READ." Apply: "food is meant to be…" — eaten. Options like "kitchen" or "cook" fail the sentence. **Answer: eaten.**

Number analogy: 3 : 27 :: 4 : ? — sentence: "3 cubed is 27." Apply: $4 \times 4 \times 4 = 64$. **Answer: 64.**

Letter analogy: AB : CD :: EF : ? — sentence: "each letter steps 1 forward (A to C, B to D)." Apply: E steps to G, F to H. **Answer: GH.**

Sequences: Differences, Then Ratios, Then Positions

A sequence question hides a rule inside 4-6 terms and asks for the next one. The rule is almost always one of three kinds, checked in this fixed order: **differences** (what do you add or subtract each step?), **ratios** (what do you multiply or divide by?), and **positions** (for letters — where do they sit in the alphabet?). Working in this order matters, because difference patterns are the most common and the quickest to test.

- **Step 1 — Take differences between neighbours.** 2, 6, 12, 20 → differences 4, 6, 8 — itself growing by 2, so the next difference is 10 → next term 30.
- **Step 2 — If differences fail, test ratios.** 2, 6, 18, 54 → each term ×3 → next is 162.
- **Step 3 — For letters, convert to positions.** Use the EJOTY anchors: E = 5, J = 10, O = 15, T = 20, Y = 25. A, C, F, J becomes 1, 3, 6, 10 — differences 2, 3, 4 → next difference 5 → position 15 → O.
- **Step 4 — Verify on EVERY term.** A pattern that fits only the last gap is a trap; run your rule across all terms before answering.
- **Mixed series exist:** alternate terms carry separate rules — 1, 4, 2, 8, 3, 12? The odd terms 1, 2, 3 climb by 1; the even terms 4, 8, 12 climb by 4.

SOLVED SEQUENCE — THE TWO-RULE TEST

Find the next term: 5, 11, 23, 47, ?

- **Differences:** 6, 12, 24 — doubling every step. So the next difference is 48.
- **Next term:** 47 + 48 = 95.
- **Verify across all terms with the doubling difference:** 5 +6→ 11 +12→ 23 +24→ 47 +48→ 95. Every step checks. **Answer: 95.**

Coding–Decoding: Find the Rule, Then Reapply

A coding question shows you a word and its coded form — CAT → DBU — and asks you to code (or decode) a new word the same way. The code is a rule, and your job is to **state the rule explicitly** before touching the new word. Compare the sample pair letter by letter, note what changed, and only then apply it. The EJOTY alphabet anchors from sequences work here too, because most codes are letter-shifts.

- **Step 1 — Compare letter by letter.** C→D, A→B, T→U: every letter moved +1.
- **Step 2 — State the rule in words.** "Each letter shifts one step forward in the alphabet."
- **Step 3 — Apply to the new word.** DOG → E, P, H → EPH.
- **Step 4 — Reverse-check on the sample.** Shift DBU back by 1: CAT. Confirmed.
- **Other rule shapes to watch:** reversed order (DOG → GOD), swapped pairs, words written backwards with a shift, and count-based codes (how many letters, vowels, or strokes). The shape of the code (length, letters vs digits) is your first hint at which family of rule you face.

SOLVED CODE — A SHIFT PLUS A REVERSE

Reverse code: If PEACE is coded as ECAEP, how is SOUND coded?

- **Compare:** PEACE → ECAEP. Reading ECAEP backwards gives PEACE — the rule is "write the word in reverse".
- **Apply to SOUND:** reversed letters give DNUOS.
- **Reverse-check:** DNUOS read backwards is SOUND. **Answer: DNUOS.**

Now a shift version: **if CAB is coded as DBC (+1 shift), code HEAD.** Each letter +1: H→I, E→F, A→B, D→E. **Answer: IFBE.** Reverse-check: IFBE shifted back is HEAD. Confirmed.

Syllogisms: Let the Venn Decide

A syllogism gives two statements — "All pens are books. Some books are red." — and asks which conclusion MUST follow. The single most important rule in this family: **your feeling about what sounds logical is irrelevant; the diagram decides**. Draw circles for the statements, then demand of each option: is this true in EVERY possible diagram that satisfies the statements? If even one arrangement breaks the option, it does not follow.

Statement type	What the circles look like	What you may conclude
All A are B	Circle A sits entirely inside circle B	Every A is a B — but NOT that every B is an A
Some A are B	Two circles overlapping	Only the overlap — nothing about "all", nothing about the non-overlapping parts
No A is B	Two circles completely separate	The two sets never meet — no A is a B and no B is an A
Some A are not B	A overlaps B, with a part of A outside	At least one A stands outside B — nothing more

- **The "must follow" test:** a conclusion follows ONLY if it survives every valid arrangement. "Some books are red" does NOT let you conclude "some pens are red" — the pen-circle inside books may sit entirely in the non-red part of books.

- **Reversed direction trap:** from "all pens are books", "all books are pens" NEVER follows — the inner circle can be smaller.
- **Possibility questions** ask "which conclusion is POSSIBLE" — there the logic flips: an option survives if even ONE valid arrangement can show it.

SOLVED SYLLOGISM — THE TWO-CIRCLE TEST

Statements: All cats are animals. All animals need food. **Conclusion to test:** All cats need food.

- **Draw:** the cats-circle sits inside the animals-circle; the animals-circle sits inside the needs-food-circle.
- **Test:** every point of cats lands inside needs-food — in EVERY arrangement, because the nesting is forced by both statements.
- **Verdict:** the conclusion must follow. **Answer: follows.**

Now break one: **Statements:** Some girls are dancers. All dancers are fit. **Option:** Some girls are fit. **Test:** the girl-dancer overlap always lands inside fit (dancers are all fit) — so "some girls are fit" is true in every arrangement. It follows. But "ALL girls are fit" fails: girls outside dancing are unconstrained. Draw, test, verdict — never feel.

Blood Relations: Draw the Tree

Blood-relation questions describe a family in a tangle of words and ask you to identify a relation. The method is disarmingly simple: **never solve in your head — draw the tree as you read**. One clue, one branch. Mark males as squares, females as circles, married pairs with an equals line, and generations on separate levels. The tangle untangles itself on paper, and the two classic traps expose themselves: the hidden gender of the speaker, and words like "only son" that are not the same as "only child".

- **Step 1 — Fix the speaker first.** Circle the speaker and mark their gender the moment the sentence reveals it. Every relation belongs to the SPEAKER, not to the listener.
- **Step 2 — Convert each phrase into a branch.** "My mother's only son" = a male child of the speaker's mother = the speaker's brother — OR the speaker himself, if the speaker is male. The tree shows both cases instantly.
- **Step 3 — Keep generations level.** Grandparents on top row, parents in the middle, children below — never let cousins climb into the parental row.
- **Step 4 — Read the question off the tree.** Count the hops: brother's father = father; father's sister = aunt. Two hops maximum in most questions — the tree makes each hop visible.
- **The pointing trap:** "Pointing to a photograph, he said, 'She is my mother's only daughter.'" The only daughter of his mother is HIS SISTER — unless the speaker is female, in which case it is the speaker herself. The sentence's gender word ("he said") settles it.

SOLVED RELATION — THE POINTING PHOTO

Question: Pointing to a photograph, Ravi says, "She is the daughter of my grandfather's only son." How is the girl related to Ravi?

- **Clue 1:** Grandfather's ONLY son = Ravi's father (a male child of the grandfather; "only" makes him unique).
- **Clue 2:** The daughter of Ravi's father = Ravi's sister.
- **Tree:** grandfather → (only son = father) → daughter = the girl in the photo, sharing Ravi's father.
- **Answer: she is Ravi's sister.** Note the trap avoided: had "only" been missing, grandfather could have several sons and the answer would be "cousin or sister" — unresolved. The word "only" is what seals it.

Direction Sense: Compass, Path, Displacement

Direction questions narrate a walk — north, then left, then right — and ask how far you ended from the start, or in which direction. The routine is always the same: draw a compass cross (N up, S down, E right, W left), draw every leg as an arrow with its distance, and then measure what the question asks. Keep two words separate in your mind: **distance** is the total path walked; **displacement** is the straight line from start to finish — two different numbers, and the question usually wants the second.

- **Step 1 — Draw the compass cross and label the start point.**
- **Step 2 — Draw each leg as an arrow.** Turn instructions like "left" apply to the direction you are FACING at that moment, not to the map's left.
- **Step 3 — Mark the end point and connect it to the start.** That line is the displacement.
- **Step 4 — Measure.** If the path forms a right triangle, use the 3-4-5 shortcut or the full Pythagoras rule: legs 3 and 4 give a straight-line distance of 5.
- **The facing trap:** "walking south, he turns LEFT" — his left is EAST on the map. Rotating the person rotates the directions with him.

OurMocks

SOLVED DIRECTION — THE 3-4-5 WALK

Question: A student walks 3 km north, turns right and walks 4 km, then stops. How far is she from her starting point, and in which direction?

- **Draw:** 3 km up (north), then a right turn while facing north = east, so 4 km to the right (east).
- **Connect start to finish:** a right triangle with legs 3 and 4.
- **Measure:** straight-line distance = 5 km (the 3-4-5 triangle).
- **Direction from start:** north-east. **Answer: 5 km, north-east.** Distance walked, note, was 7 km — a different question with a different answer.

Puzzles: Build the Slot Table

Seating and ordering puzzles give five or six people and a list of clues, then ask who sits where. The winning habit is the **slot table**: draw a row (or circle) of empty slots, fill the DEFINITE clue first, and chain every other clue from what is already fixed. When you think you are done, re-read every clue against your table — the last clue you forgot is almost always the one that splits two tempting options.

- **Step 1 — Draw the frame.** A row of slots for linear arrangements; a circle for round tables. Mark the facing direction FIRST — facing north vs south flips every left/right clue.
- **Step 2 — Fix the definite clues.** "C sits in the middle" goes in ink; everything else chains from it.
- **Step 3 — Chain the conditional clues.** "A sits second to the right of B" — place B from a fixed anchor, then A relative to B.
- **Step 4 — Re-read every clue.** Tick each clue off against the final table; an unsatisfied clue means the arrangement is wrong, not the puzzle.
- **Order puzzles (ranks, heights, dates) use the same method vertically** — a column of slots with $>$ and $<$ arrows between them.

SOLVED SEATING — FIVE FRIENDS, ONE ROW

Clues: Five friends A, B, C, D, E sit in a row facing north. C sits in the middle. A sits at the extreme left. E sits second from the right. B is NOT next to A. **Question:** who sits at the extreme right?

- **Fix definites:** slots 1-2-3-4-5. A → slot 1. C → slot 3. E → slot 4.
- **Chain:** B is not next to A, so B cannot take slot 2 — B takes slot 5. D fills the leftover slot 2.
- **Re-read all clues:** A1 D2 C3 E4 B5 — every clue satisfied, north-facing lefts never used but held ready.
- **Answer: B sits at the extreme right.** The slot table did the thinking; the re-read did the checking.

Key Rules and Strategies: One-Stop Revision

LOGICAL & ANALYTICAL REASONING — EVERY METHOD ON ONE PAGE

Family	The fixed routine	The trap it defuses
Analogies	Say the relationship as a sentence; apply the same sentence to the third term	Category-instead-of-relation options
Sequences	Differences → ratios → letter positions; verify on every term	One-gap pattern trust

Family	The fixed routine	The trap it defuses
Letter positions	EJOTY anchors: E=5, J=10, O=15, T=20, Y=25	Slow alphabet counting
Coding-decoding	Compare sample letter by letter; state the rule; apply; reverse-check	Assumed uniform shifts
Syllogisms	Draw Venn circles; a conclusion must hold in EVERY arrangement	"Sounds logical" feel-arguments
Blood relations	Tree with squares/circles; speaker's gender first; one clue per branch	Only son vs only child; speaker gender
Direction sense	Compass cross; arrow per leg; left = YOUR left while facing	Map-left instead of facing-left
Displacement	Straight line start-to-finish (3-4-5 shortcut), NOT the total path	Distance vs displacement swap
Puzzles	Slot table; definite clue first; chain; tick every clue at the end	Forgotten last clue; facing flips
Universal rule	Draw on paper — the pencil holds more than working memory	Head-juggling errors
Universal check	Verify the full rule before marking — fits-every-term or it fails	Overconfident first answers
Marking maths	+5 right, −1 wrong: drawn-and-checked attempts only	Wild guessing

Common Errors and Special Cases

THE TRAPS THIS TOPIC SETS — READ BEFORE THE MOCK

The habit you assume	The twist	The trap in the question
"The option from the right category is right"	Analogies test the RELATIONSHIP, not the category	Analogy distractors
"A pattern fitting the last gap is the rule"	The rule must reproduce EVERY term	Sequence options

The habit you assume	The twist	The trap in the question
"Codes always shift letters uniformly"	Reversals and swaps hide inside codes	Coding-decoding options
"A conclusion that sounds reasonable follows"	Syllogisms follow only what is TRUE IN EVERY diagram	Syllogism conclusions
"Relations read from the listener's side"	Relations belong to the SPEAKER of the sentence	Pointing-to-photo questions
"Only son means only child"	A mother's only son can still have daughters	Family-tree branches
"Left on the map is left for the walker"	Left is relative to the direction being FACED	Direction-sense turns
"Total distance answers 'how far from start'"	That asks for DISPLACEMENT — the straight line	Distance-displacement swap

The 60-Second Self-Test

Cover the answers, say each one aloud, then check. If any answer takes longer than ten seconds, revisit that section.

- **First move on any analogy question?** → Say the relationship of the given pair as a simple sentence.
- **The three checks for a series, in order?** → Differences, then ratios, then letter positions.
- **EJOTY stands for?** → E=5, J=10, O=15, T=20, Y=25 — instant alphabet positions.
- **When does a syllogism conclusion "follow"?** → Only when true in EVERY diagram that satisfies the statements.
- **"He is my mother's only son" — who is he, if the speaker is female?** → Her brother.
- **3 km north + 4 km east — how far from start?** → 5 km (straight line), though 7 km were walked.

The Whole Chapter in One Picture

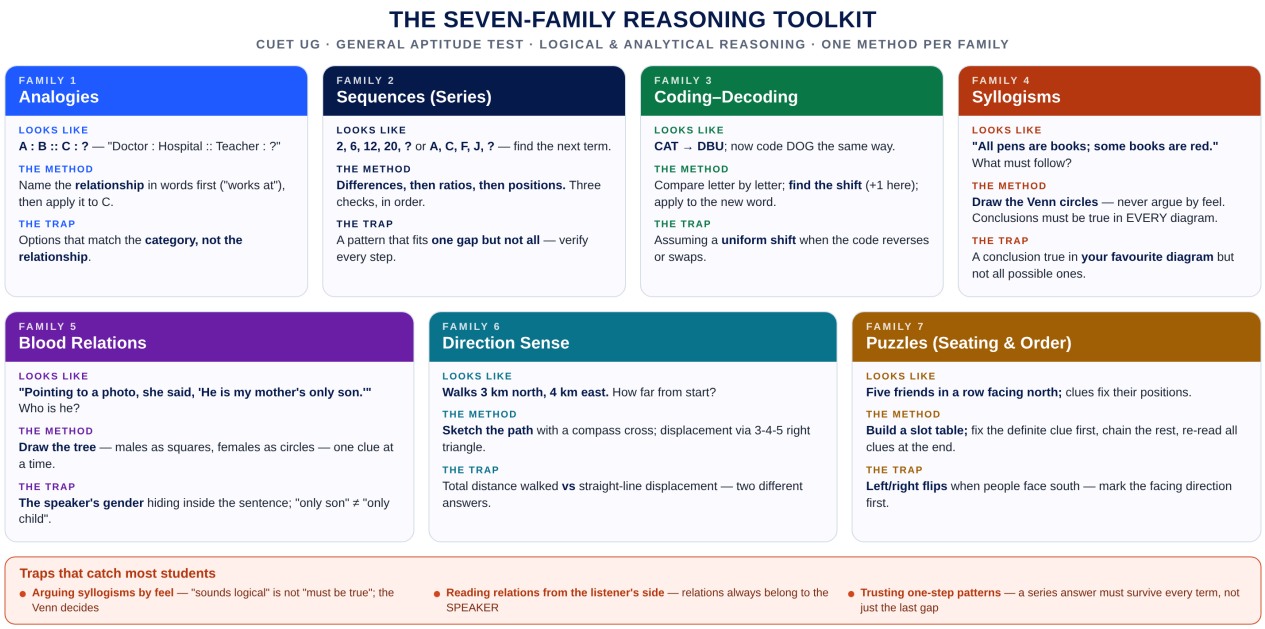

Figure 1: The seven-family reasoning toolkit — what each family looks like, its fixed routine, and the trap hiding inside it.

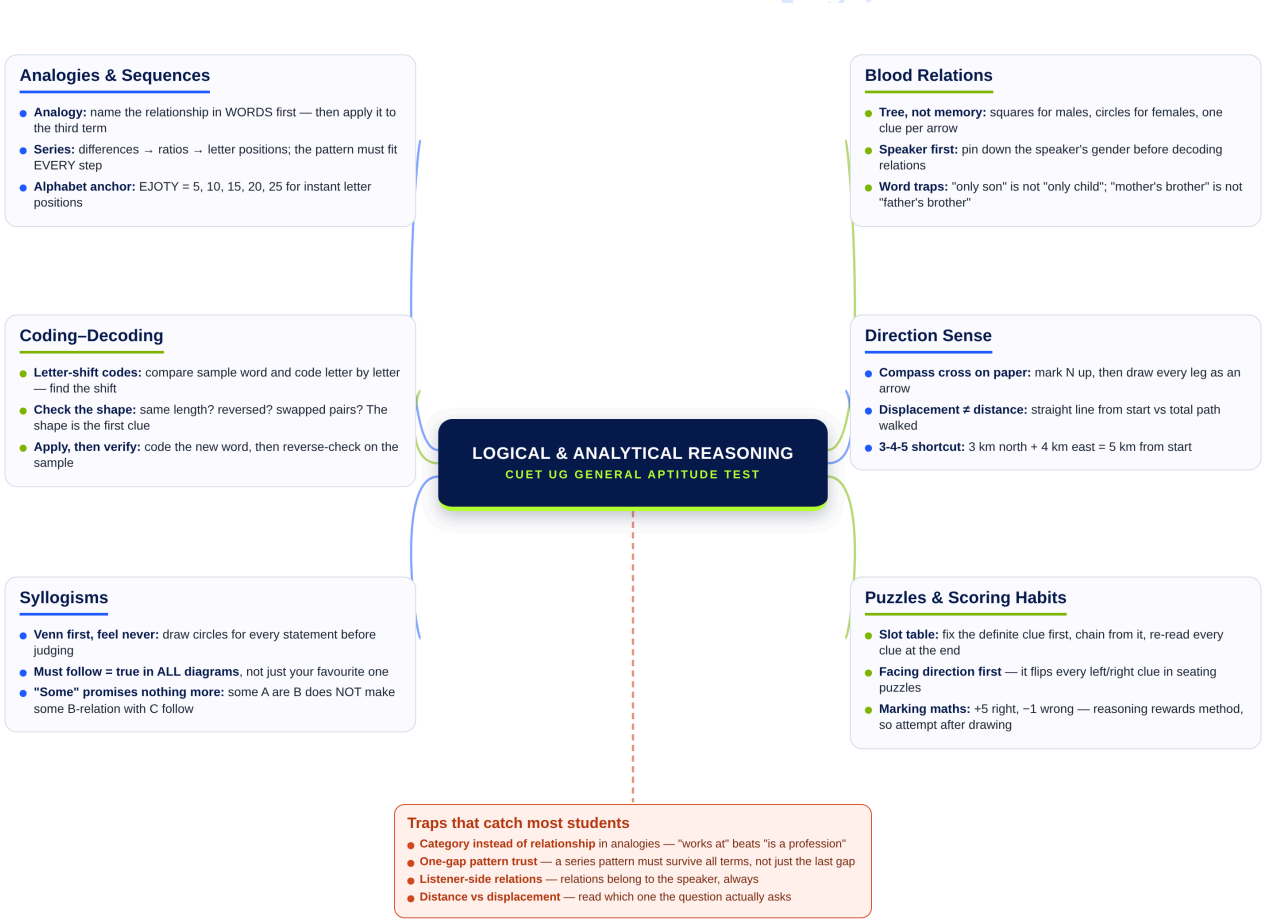

Figure 2: Chapter mindmap: the seven families, the drawing-first habit behind all of them, and the traps that catch most students.

Practice Questions (Exam Pattern)

Ten questions in the CUET UG style — one from each family plus three extra across the classics. Draw before you choose; each correct answer earns +5 and each incorrect one costs −1.

Q1. Pen : Write :: Knife : ?

(A) kitchen
(B) sharp
(C) cut
(D) steel

Q2. Find the next term: 3, 6, 11, 18, 27, ?

(A) 36
(B) 38
(C) 40
(D) 35

Q3. Find the next term: A, C, F, J, ?

(A) M
(B) N
(C) O
(D) P

Q4. If BOOK is coded as CPPL, then LOOK is coded as:

(A) MPPL
(B) MPQQ
(C) MQPL
(D) NPPL

Q5. Statements: All roses are flowers. Some flowers fade quickly. Which conclusion MUST follow?

(A) All roses fade quickly
(B) Some roses fade quickly
(C) No rose fades quickly
(D) None of these conclusions must follow

Q6. Pointing to a man, Meera (a woman) says, "He is the son of my father's only son." How is the man related to Meera?

(A) Her brother
(B) Her nephew
(C) Her son
(D) Her cousin

Q7. A boy walks 5 km south, turns left and walks 12 km, then stops. How far is he from his starting point?

(A) 17 km
(B) 13 km
(C) 7 km
(D) 12 km

Q8. Five students P, Q, R, S, T sit in a row facing north. R sits in the middle. P sits at the extreme right. S sits exactly between R and P. Q does NOT sit at either end. Who sits at the extreme left?

(A) Q
(B) S
(C) T
(D) P

Q9. If in a certain code, TEA is written as VGC, then SKY is written as:

(A) UMA **(B)** ULA
(C) VMA **(D)** UMZ

Q10. Statements: Some teachers are players. All players are students. Which conclusion MUST follow?

(A) Some teachers are students **(B)** All teachers are students
(C) All players are teachers **(D)** No teacher is a student

Detailed Solutions

Each solution shows the working, not just the verdict — cover the answer line, attempt the reasoning, then compare.

Sol. Q1. Relationship sentence: "A pen is used to WRITE." Apply: "a knife is used to…" — cut. Kitchen and steel are category neighbours, not the relationship; sharp is a property.

Answer: (C)

Sol. Q2. Differences: 3, 5, 7, 9 — growing by 2. Next difference: 11 → 27 + 11 = 38. Verified across every term: 3 +3→ 6 +5→ 11 +7→ 18 +9→ 27 +11→ 38.

Answer: (B)

Sol. Q3. Positions via EJOTY: A=1, C=3, F=6, J=10 — differences 2, 3, 4. Next difference 5 → position 15 = O.

Answer: (C)

Sol. Q4. Compare BOOK → CPPL: each letter +1 (B→C, O→P, O→P, K→L). Apply to LOOK: L→M, O→P, O→P, K→L. Reverse-check: MPPL shifted back is LOOK.

Answer: (A)

Sol. Q5. Draw: the roses circle sits inside flowers; the fading flowers may all lie OUTSIDE the roses circle — every valid diagram allows it. So none of A, B, C must follow. Careful: "must follow" is a strict test.

Answer: (D)

Sol. Q6. Tree: Meera's father's ONLY son = Meera's brother (the word "only" makes him the unique male child — he cannot be Meera's father, who is the grandfather here). The man is that brother's son → Meera's NEPHEW.

Answer: (B)

Sol. Q7. Draw: 5 km down (south), then left while facing south = east, 12 km east. Right triangle with legs 5 and 12: 5-12-13 triangle → displacement 13 km. Distance walked was 17 km — the trap option A.

Answer: (B)

Sol. Q8. Slots 1-5, facing north. Definites first: R -> 3 (middle), P -> 5 (extreme right). Chain: "S exactly between R and P" gives slot 4. "Q not at either end" leaves only slot 2 free among the non-end slots, so Q -> 2. T fills slot 1. Re-read every clue against the final row T-Q-R-S-P: all satisfied, arrangement unique. Answer: T at the extreme left.

Answer: (C)

Sol. Q9. Compare TEA → VGC: each letter +2 (T→V, E→G, A→C). Apply to SKY: S→U, K→M, Y→A (Y wraps: Y +2 → A). Reverse-check: UMA shifted back is SKY.

Answer: (A)

Sol. Q10. Draw: the teachers circle overlaps the players circle; the whole players circle sits inside students. The overlap — teachers who are players — lands inside students in EVERY valid diagram, so "some teachers are students" must follow. Option B over-reaches (teachers outside players are unconstrained); C reverses "all players are students"; D contradicts the overlap.

Answer: (A)

Wrong-Answer Clinic — the one-line corrections

Dropped marks above? Find your slip here and rewrite the corrected rule in your own words.

If you answered...	Your slip was...	The corrected rule, in one line
Q1 option A or B	Choosing from the right category instead of the relation	The relationship sentence decides — "used to CUT"
Q2 option A	Continuing the differences carelessly	Differences 3,5,7,9 grow by 2 — next is 11, giving 38
Q5 option B	Letting "some flowers" leak into "some roses"	The fading overlap may sit outside roses — Venn, then verdict
Q7 option A	Reporting distance walked as displacement	How far from START = straight line: 5-12-13 → 13 km
Q8 option A	Leaving Q at the left end	The no-ends clue pushes Q to slot 2 — slot 1 goes to T
Q9 option D	Dropping the wrap-around at Z	Y + 2 wraps to A — keep the alphabet circular

If you answered...	Your slip was...	The corrected rule, in one line
Q10 option C	Reversing an "all" statement	All players are students never becomes all students are players

Your 7-Day Reasoning Drill Plan

Seven families, seven days, twenty minutes a day — one family per evening, five questions deep, then a mixed round at the week's end. The plan works because reasoning is a habit of drawing, and habits grow by short daily reps, not weekend marathons. Keep a rough sheet beside you and DRAW on every single question, even the easy ones — the drawing is the training.

Day	Family of the day	What to check while drilling
Day 1	Analogies	Did you SAY the relationship sentence before touching the options?
Day 2	Sequences	Did you test differences, then ratios, and verify on EVERY term?
Day 3	Coding-decoding	Did you state the rule in words and reverse-check on the sample word?
Day 4	Syllogisms	Did you draw the circles and test the conclusion in EVERY arrangement?
Day 5	Blood relations + direction sense	Tree drawn with genders marked? Compass cross drawn before measuring?
Day 6	Puzzles (seating and order)	Slot table built, definite clue first, every clue ticked at the end?
Day 7	Mixed timed round	All seven routines holding under the clock? Which family still tempts you to skip the drawing?

- **Keep a slip diary:** one line per mistake — the family, the trap that caught you, the corrected rule in your own words.
- **Re-read the slip diary** before the exam — it is the shortest, highest-value revision you own.
