Syllabus Alignment

Sub-topic	Official syllabus pointer (NTA CUET(UG) Business Studies syllabus 2026, the current 2027 baseline, Unit I)	Skills the questions test
Management — concept, objectives, importance	Management – concept, objectives, importance.	Stating the definition with both words — effectively **and** efficiently; classifying objectives as organisational, social or personal; picking the right reason from the five importance points.
Nature of management — science, art, profession	Nature of management; Management as Science, Art, Profession.	Matching each feature (systematised body of knowledge, personal skill, restricted entry…) to science, art or profession, and arguing the "partly / not exact / not yet" verdicts.
Levels of management	Levels of management – top, middle supervisory (First level).	Placing job titles (CEO, departmental head, foreman) at the correct level and matching each level to its functions and time horizon.
Management functions	Management functions – planning, organising, staffing, directing and controlling.	Naming all five functions in order, attaching the core question each answers, and spotting the planning–controlling link.
Coordination — nature and importance	Coordination – nature and importance.	Listing the six nature features, separating coordination from cooperation, and explaining why coordination is called the essence of management.

EXAM PATTERN

CUET UG pattern (NTA official information bulletin and syllabus, 2026 cycle — the current 2027 baseline): each subject paper carries **50 compulsory questions** in **60 minutes**, with +5 for every correct answer and −1 for every incorrect answer. Unit I opens the Business Studies paper and supplies the vocabulary every later unit assumes — planning, organising, staffing, directing and controlling are entire units of their own, so the definitions learned here return again and again.

What Management Actually Is

Think of the last big event your school organised — the annual day, a sports meet, a fair. Fifty students were willing to help, the money existed, the auditorium was booked. Yet nothing would have happened on stage without a small group of people deciding **who** does **what**, **by when**, checking the sound test, and updating the principal. That group was not dancing or anchoring — it was doing **management**: turning willing people, money and materials into an organised result. This chapter defines that activity, states its objectives, argues about its nature, and ends with the one force that holds every organisation together — coordination.

- **The official definition:** management is **the process of getting things done with the aim of achieving goals effectively and efficiently**. Read the definition slowly — it carries three ideas: it is a **process**, it works **through people**, and it aims at goals achieved **effectively and efficiently**.
- **A process:** not one act but a series of interlinked functions — planning, organising, staffing, directing and controlling — carried on again and again.
- **Through people:** a manager does not make the product, teach the class or score the goal; a manager gets these things done **with and through other people**. Doing everything alone is hard work, not management.
- **Effectively** means finishing the **right** task and reaching the goal — completing the work on time as planned.
- **Efficiently** means reaching that goal at **minimum cost** — using the least time, money, material and effort possible.

Effectiveness vs efficiency — the pair every question plays with

The two words look interchangeable in daily talk, but in this chapter they are sharply different, and questions are built on that difference.

Point	Effectiveness	Efficiency
Meaning	Completing the task on time and achieving the final goal	Completing the task with the minimum resources and cost
Focus	The **end result** — did we reach the goal?	The **cost of reaching** it — at what price?
Question asked	"Did we do the right thing, on time?"	"Did we do the thing at the least cost?"

Point	Effectiveness	Efficiency
Concerned with	Targets, deadlines, quality of achievement	Inputs, wastage, cost per unit
Example	Order delivered by the promised date	Order delivered with the least fuel and overtime

- **Both are needed:** reaching the goal wastefully (costly) or saving money but missing the goal are **both** failure. A firm that ships late loses customers; a firm that ships on time but overspends loses profit.
- **Efficiency of the wrong task is worth zero:** perfectly cutting fabric for a design nobody ordered is efficient and useless at the same time — effectiveness decides **which** task, efficiency decides **how cheaply**.

EVERYDAY EXAMPLE — REACHING THE EXAM HALL

Your exam starts at 9 a.m. Leaving home at 8:40 and arriving exactly on time is **effectiveness** — the goal, achieved. Taking the shorter route that skips traffic and reaches with less fuel and panic is **efficiency** — the same goal at minimum cost. A friend who leaves at 8:40 but takes a long crowded route was effective but not efficient; a friend who finds a short route but leaves so late that the gate is closed was efficient about travel and not effective about the goal. Management insists on **both** boxes being ticked.

Characteristics of management

Each feature below is a one-mark candidate: learn the label, the one-line explanation and one example.

- **Goal-oriented process:** management exists only to achieve predetermined goals — no goals, no management. A cricket team's coach plans, trains and motivates **for the trophy**, not for the pleasure of drills.
- **All-pervasive:** management is needed in every organisation, big or small, profit or not — companies, schools, hospitals, clubs, even a family function. What changes is the scale, not the need.
- **Multidimensional:** management is never one job; it is simultaneously the management of **work**, of **people** and of **operations** (see the table below).
- **Continuous:** managers plan, check and correct all the time — the process does not end when a target is met, because new targets follow at once.
- **Group activity:** an organisation has many people with different needs; management binds their separate efforts into one combined result.
- **Dynamic function:** the environment — technology, tastes, laws — keeps changing, and management must keep adapting; firms that ignored smartphones lost to firms that adjusted.
- **Intangible force:** you cannot see management, only its results — orderliness where there was confusion, discipline where there was delay, sold-out stock where shelves were empty.

The three dimensions of management

"Multidimensional" is the characteristic that deserves its own table, because questions list its parts in shuffled order.

Dimension	What it means	Example
Management of work	Every organisation exists to do some work; that work is translated into targets and tasks	A school translates its purpose into syllabus coverage and exam schedules
Management of people	Getting work done through people — employees and also customers, suppliers, regulators	Assigning duties, training a new lab assistant, handling a supplier
Management of operations	Managing the production process that converts input into output	A bakery managing mixing, baking and packing so bread is ready before dawn

ONE-LINE DEFINITIONS TO CARRY

- **Management:** process of getting things done with the aim of achieving goals **effectively and efficiently**.
- **Effectiveness:** reaching the goal — the **end**.
- **Efficiency:** reaching the goal at minimum cost — the **means**.

Objectives and Importance of Management

Why does an organisation employ managers at all? Because it wants three families of results achieved at once — results for the **organisation** itself, results for the **society** around it, and results for the **people** who work in it. Questions rarely ask the list straight; they hand you an example — "installing a water-treatment plant" or "paying a below-average performer a fair raise" — and ask which family it belongs to. Learn the families with their examples, not as bare words.

Organisational objectives — the three every firm must chase

- **Survival:** earn enough revenue to cover costs; an organisation that cannot pay its bills stops existing. Survival is the first duty of management.
- **Profit:** the extra over cost that rewards risk-taking and pays for tomorrow's plans. Profit is the reward a business earns for covering its costs and taking risks.
- **Growth:** becoming bigger over time — more employees, more capacity, more sales, more branches. Growth is measured by increases in revenue, workforce or investment.

Social and personal objectives

- **Social objectives:** producing goods with **environment-friendly methods**, providing **basic amenities** (schools, crèches, drinking water) to employees and the neighbourhood, and creating **employment opportunities for disadvantaged sections** of society.

- **Personal objectives:** employees are people with their own goals — **competitive salaries**, **peer recognition**, and **personal growth**. Management must satisfy these so that talented people stay and contribute; a firm that ignores its people's goals loses exactly those people.

Objective family	Members and recognisable examples
Organisational	Survival (cover costs) · Profit (reward for risk) · Growth (more capacity, people, sales)
Social	Environment-friendly production · basic amenities for employees and community · jobs for disadvantaged groups
Personal	Competitive pay · peer recognition · growth opportunities for each employee

Why management matters — the five importance points

- **Helps in achieving group goals:** individual employees pull in personal directions; management aims all those separate efforts at the **common objective** of the organisation.
- **Increases efficiency:** through better planning, organising and controlling, management lowers cost and raises output — the same inputs produce more.
- **Creates a dynamic organisation:** employees naturally resist change; management builds an organisation that **accepts and adapts to change** so the firm survives in a shifting environment.
- **Helps in achieving personal objectives:** through motivation and leadership, management helps each employee move toward their own salary, recognition and growth goals while working for the firm.
- **Helps in the development of society:** better products at fair prices, jobs, new technology and rising standards of living — management's choices decide whether an organisation feeds society or merely extracts from it.

EVERYDAY EXAMPLE — THE ENGINE OF THE BUS

Compare an organisation to a school bus. Students, driver, teacher-on-duty are the **people and resources**; the school is the **society**; the route is the **plan**. The engine that turns fuel into forward motion — silently, all day — is **management**. Nobody praises an engine while it works, but stop the engine and the whole bus stops. That is exactly the "intangible force" idea: you cannot see management, you only see whether the bus is moving.

Management as Science, Art and Profession

Is management a science like physics, an art like painting, or a profession like medicine? The honest answer is a careful mixture — and questions test whether you can defend **why** it qualifies partially for each label and where it falls short. Learn each label by its features, then argue the verdict.

Management as a science

A field qualifies as science when it has a **systematised body of knowledge** with principles developed through **observation and experimentation**, principles that have **universal validity** — true everywhere, every time.

- **Systematised body of knowledge:** management has its own theories, vocabulary and principles (unity of command, division of work, and so on) arranged in an organised way.
- **Principles from experimentation:** management principles emerged from the studied experience of managers and are tested and refined over time.
- **But not exact:** the subject deals with **human beings**, whose behaviour cannot be predicted precisely in a laboratory. The same sales pitch that works in one city fails in another. That is why management is called an **inexact science** — or a **social science** — its principles are flexible, not rigidly universal like those of physics or chemistry.

Management as an art

An art is the **skilful, personal application** of knowledge to get desired results — and management satisfies every test of art.

- **Practical knowledge:** a manager learns how to motivate a demoralised team by **doing** it, not by reading alone.
- **Personal skill:** every manager applies the same theory in their own style — two managers running identical departments produce different results.
- **Creativity and perfection through practice:** managing gets better with experience; results improve as judgment sharpens — exactly like painting, cooking or surgery improve with practice.

Management as a profession

A profession shows five signs: a systematised body of knowledge, **restricted entry** through an examination or licence, a **professional association**, an agreed **ethical code**, and **service motive** above pure profit.

Feature	Does management have it?	Evidence
Systematised body of knowledge	Yes	MBA courses, management texts, established theories
Restricted entry	No	Anyone can become a manager without a compulsory licence — no bar exam for managing
Professional association	Partly	AIMA (All India Management Association) exists, but **registration is not compulsory**

Feature	Does management have it?	Evidence
Ethical code	Partly	Codes exist but are not legally binding on all managers
Service motive	Partly	Firms increasingly value social goals, but profit remains central

- **The exam verdict:** management is a science (an inexact, social one), an art (in fact more art than science in daily practice), and **not yet a full profession** — it satisfies some conditions but has no compulsory entry requirement or binding ethical code.

EVERYDAY EXAMPLE — LEARNING TO DRIVE

The traffic rulebook — signals, right of way, stopping distances — is the **science** part: written, learnable, systematised. Actually steering through Monday traffic with your own timing, glance and calm is the **art** part — personal skill improved by practice. Driving is **not** a profession in the strict sense either: a licence is needed, but a manager's "licence" is not. Same three verdicts, one everyday picture.

Levels of Management

No manager can supervise everyone directly — a company with thousands of workers arranges managers in **levels**, one above the other, so that authority is shared and every group of employees has a responsible head. The syllabus names three levels, and questions keep testing which job title and which duty belongs to which level.

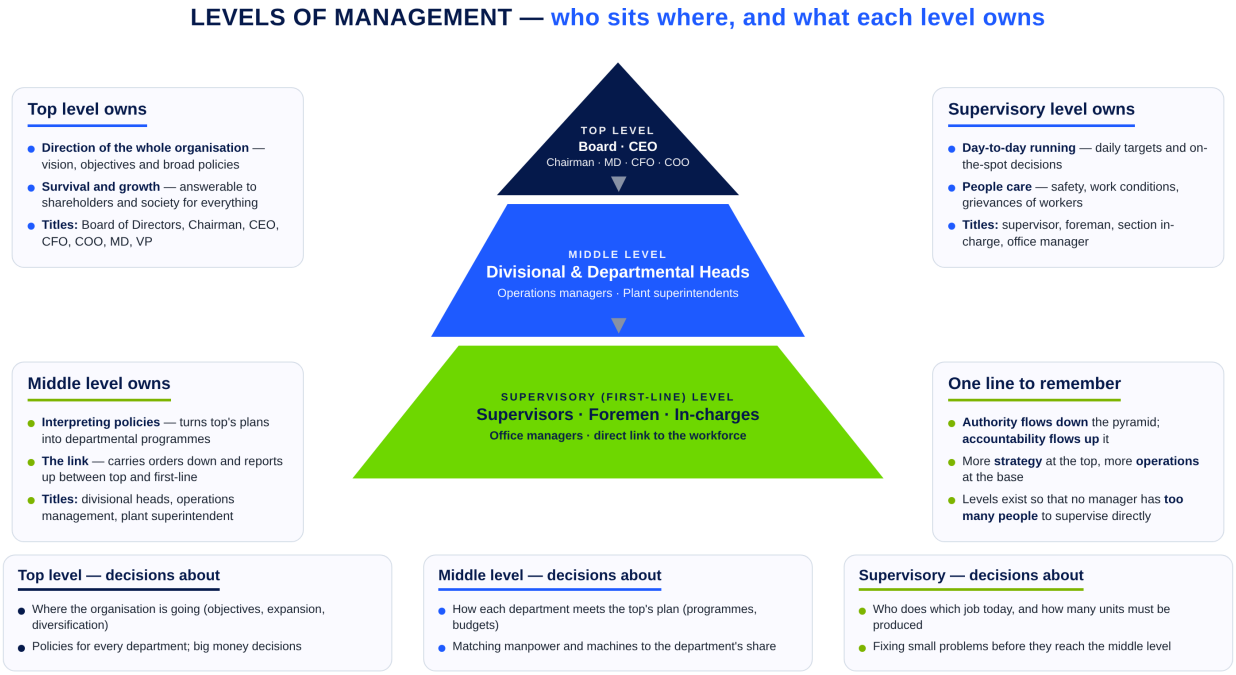

Figure 1: Figure 1 — The three levels of management: who sits at each level, what that level owns, and the kind of decisions it takes.

Top level — the direction-setters

- **Who:** Board of Directors, Chairman, Chief Executive Officer, Managing Director, Chief Financial Officer, Chief Operating Officer, Vice-Presidents.
- **What they do:** decide the **objectives and broad policies** of the whole organisation — expansion, diversification, major finance. They integrate all departments and are answerable to shareholders and society for the welfare and survival of the firm.
- **Time horizon:** years. Their decisions are few, expensive and long-lasting.

Middle level — the link

- **Who:** divisional heads, departmental managers, operations managers, plant superintendents.
- **What they do: interpret** the top's policies for their own department, convert them into programmes and budgets, recruit and train department staff, and act as the **link** — passing orders downward and reports upward.
- **Time horizon:** months to a year. Their decisions translate strategy into departmental plans.

Supervisory (first-line) level — the floor commanders

- **Who:** supervisors, foremen, section in-charges, office managers — the managers workers meet daily.

- **What they do:** assign **daily tasks**, maintain **quality** of output, watch **safety** and working conditions, sort out workers' grievances, and reduce absenteeism and idle time by acting on problems on the spot.
- **Time horizon:** today and this week. Their decisions are many, small and immediate.

Level	Typical titles	Owns	Horizon
Top	Chairman, CEO, MD, CFO, COO, VP	Objectives, policies, survival and welfare of the whole firm	Years
Middle	Divisional and departmental heads, plant superintendent	Interpreting policies, departmental programmes, linking top and first-line	Months
Supervisory	Supervisor, foreman, section in-charge, office manager	Daily targets, quality, safety, grievances of workers	Days

The Five Functions of Management

Whatever a manager's level or industry, the work resolves into five linked functions. Each answers one core question; together they form a repeating cycle rather than a straight line. Later units of this paper expand each function into a full chapter, so the one-line understanding fixed here pays dividends for the whole subject.

- **Planning:** deciding **in advance** what to do, how to do it, when to do it and who is to do it — bridges the gap between where we stand and where we want to reach. It is the base on which every other function rests.
- **Organising:** after the plan exists, grouping activities, assigning duties and fixing **authority and responsibility** relationships — deciding who reports to whom and who may decide what.
- **Staffing:** filling and keeping filled the positions the structure created — recruiting the **right person for the right job**, training, appraising and promoting.
- **Directing:** leading the people who hold the jobs — supervising, motivating, communicating and guiding, so that employees actually **act** on the plan willingly and well.
- **Controlling:** measuring actual performance against the **standards set in planning**, finding deviations and taking corrective action — the function that closes the loop back to planning.

Function	Core question it answers	Quick example
Planning	What is to be achieved, and how, by when?	Deciding to launch a new snack before Diwali and setting the sales target
Organising	Who does which task, with what authority?	Creating a marketing team and appointing its head

Function	Core question it answers	Quick example
Staffing	Who will fill each position, and are they trained?	Hiring two sales executives and training them
Directing	How do we make people act willingly?	Motivating the team with recognition for the launch week
Controlling	Did actual performance match the standard?	Comparing week-one sales with the target and correcting the shortfall

- **The cycle, not the line:** controlling compares results with the standard that **planning** created; the lessons feed next year's plan. So the five functions circle continuously — this planning–controlling link is a favourite question.

THE FIVE FUNCTIONS — ONE LINE EACH

- **Planning** — decide the goal and the path, in advance.
- **Organising** — build the structure of tasks, authority and responsibility.
- **Staffing** — put the right person in each position, and keep them growing.
- **Directing** — lead, motivate and communicate so people act.
- **Controlling** — compare results with standards, correct the deviations.

Coordination — The Essence of Management

When dozens of specialists pull a project in their own directions, effort cancels effort. The force that times and tunes all those efforts so they add up to one result is **coordination** — the force that **synchronises and integrates** the actions of a group toward common objectives. The syllabus calls it the **essence** of management: it is not a separate sixth function but the quality that must run through **all five functions, at every level**.

Why coordination becomes necessary

- **Growth in size:** as an organisation hires more people, total effort rises — but so does the risk of people working at cross purposes. Coordination keeps thousands of individual efforts aligned.
- **Functional differentiation:** departments are divided by purpose — finance, production, marketing, personnel. Each develops its own priorities and vocabulary; coordination makes finance's cost sense and marketing's sales push add up instead of clash.
- **Specialisation of work:** experts think in the language of their own speciality and may judge every issue by it. Coordination reconciles the specialist viewpoints so the organisation gets their combined judgment, not their separate conclusions.

The nature of coordination

- **Integral function:** not a bolt-on task — without coordination the organisation's departments stop being an organisation.

- **Continuous:** it is needed as long as the organisation runs; it begins with planning and ends only when the activity ends.
- **Group effort:** it binds many people's efforts, not one person's; it has meaning only when work is divided.
- **All-pervasive:** needed at every level (top, middle, supervisory) and in every department — everywhere people work in groups.
- **Responsibility of all managers:** every manager, at any level, coordinates the efforts under them; it is nobody's exclusive department.
- **Deliberate:** coordination does not happen by luck — managers must **consciously act** to synchronise efforts, through meetings, plans and adjustments.

Coordination vs cooperation — the classic trap pair

Point	Cooperation	Coordination
Meaning	Voluntary willingness of people to help each other	Deliberate synchronisation of group efforts toward common goals
Nature	An attitude — people **want** to help	A planned effort — managers **make** efforts align
Scope	Narrow — only willingness to assist	Wider — includes cooperation and goes beyond it
Guarantee	Cooperation **without** coordination still leaves chaos	Coordination is achieved **through** cooperation plus direction

EVERYDAY EXAMPLE — THE ROWING EIGHT

A rowing boat with eight rowers: every rower rowing hard is **cooperation** — willingness, effort, goodwill. But if each rower strokes at a different moment, the boat jerks and spins however hard they row. The boat glides only when all eight strokes are **timed to one rhythm** — that timing is **coordination**. Rowing hard is voluntary; keeping time is deliberate, and it is the coxswain's job to maintain it. That is why the syllabus says cooperation alone is **not enough**.

Key Facts & Terms Cheatsheet

KEY FACTS & TERMS CHEATSHEET — UNIT I (NATURE AND SIGNIFICANCE)

Term / fact	What it means	Example / number
Management (definition)	Process of getting things done to achieve goals effectively and efficiently	Three ideas: process, through people, both E-words
Effectiveness	Task completed on time; the goal reached — the **end**	Order shipped by the promised date
Efficiency	Goal reached at minimum cost — the **means**	Same order shipped with least fuel and overtime
Characteristics (7)	Goal-oriented, all-pervasive, multidimensional, continuous, group activity, dynamic, intangible	Intangible: seen only in results
Three dimensions	Management of work, of people, of operations	Bakery: recipes, staff, production line
Organisational objectives	Survival, profit, growth	Profit = reward for risk-bearing
Social objectives	Eco-friendly production, basic amenities, jobs for disadvantaged groups	Water-treatment plant installed by a factory
Personal objectives	Competitive salary, peer recognition, growth of employees	Fair raise for a below-average performer
Importance (5)	Group goals, efficiency, dynamic organisation, personal objectives, development of society	Dynamic: helps members accept change
Science verdict	Yes — but **inexact / social** science; human behaviour is not laboratory-exact	Same policy works in one city, fails in another
Art verdict	Yes — personal skill, creativity, perfection through practice	Two managers, same theory, different results
Profession verdict	**Not yet a full profession** — no compulsory licence or binding code; AIMA optional	Anyone can manage without a bar-exam
Levels	Top (CEO, board) → Middle (dept heads) → Supervisory (foremen)	Authority down, accountability up

Term / fact	What it means	Example / number
Functions (5)	Planning, organising, staffing, directing, controlling	Controlling compares results with **planning's** standards
Coordination	Deliberate synchronisation and integration of group effort	Rowing eight keeping one rhythm
Coordination vs cooperation	Cooperation = voluntary willingness; coordination = deliberate, wider, includes it	Hard rowing vs timed rowing

Carry everywhere: effectively **and** efficiently (never swap them); management is needed in **every** organisation; coordination is the **essence**, not a sixth function.

Common Errors and Special Cases

COMMON ERRORS & SPECIAL CASES

The mistake students make	What is right	The why / the trap
"Effectiveness means doing work cheaply"	Cheapness is **efficiency**; effectiveness is **achieving the goal on time**	End vs means — effectiveness judges the result, efficiency judges the cost of getting it.
"Management is needed only in big business firms"	Management is **all-pervasive** — schools, hospitals, clubs and families all need it	Scale changes, need does not; profit is not the trigger.
"Management is a full profession like law"	It is **not yet** a full profession — no compulsory entry test, licence or binding ethical code	AIMA exists but joining it is optional; that single fact kills the 'full profession' claim.
"Management principles are exact like physics"	Management is an **inexact (social) science** — principles are flexible	Human behaviour cannot be predicted in a laboratory; the same policy succeeds in one city and fails in another.
"Coordination and cooperation mean the same thing"	Cooperation is voluntary willingness; coordination is	Willing workers without timing still produce chaos

The mistake students make	What is right	The why / the trap
	deliberate synchronisation and is **wider**	— the rowing-eight picture.
"Coordination is a separate department's job"	Coordination is the **responsibility of all managers at all levels** — it is the essence, not a sixth function	There is no 'department of coordination'; it must flow through all five functions.
"Foremen belong to the middle level"	Foremen and supervisors are the **first-line (supervisory) level**	Job titles are the trap: 'plant superintendent' is middle, 'foreman' is supervisory — memorise titles level-wise.

- **Spot the pattern:** most traps here are **swapped pairs** — effectiveness vs efficiency, cooperation vs coordination, science vs exact science, levels by title. When revising, always test the pair together.
- **One special case:** a question may hand you a manager's job title and ask the level — read the **word**, not the salary: "foreman" always supervisory, "superintendent" always middle, "CEO" always top.

OurMocks

The Whole Chapter on One Page

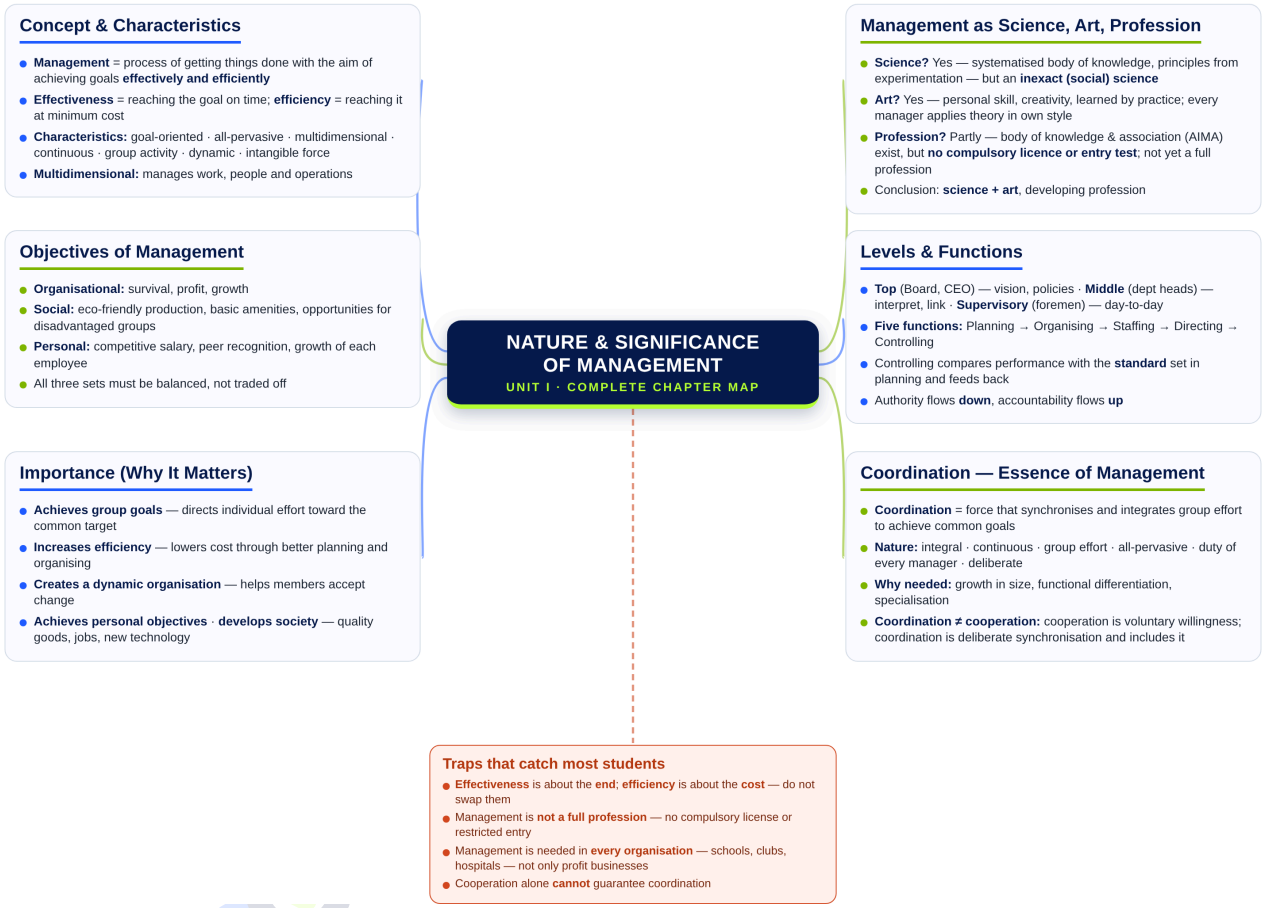

Figure 2: Figure 2 — Whole chapter on one page: concept and characteristics, objectives, importance, the science-art-profession verdicts, levels, the five functions and coordination, with the four traps that catch most students.

Practice Questions

Q1. A firm completes its order on the promised date but spends far more on overtime than its competitor did. In terms of the definition of management, the firm is:

(A) effective but not efficient
(B) efficient but not effective
(C) both effective and efficient
(D) neither effective nor efficient

Q2. Management is called an "intangible force" because:

(A) it cannot be measured in money
(B) it cannot be seen, but its presence is felt in the orderliness and discipline of the organisation
(C) it has no physical premises
(D) it exists only in the minds of the top level

Q3. The three dimensions over which management is spread are:

(A) planning, organising, controlling
(B) management of work, management of people, management of operations
(C) top level, middle level, supervisory level
(D) science, art, profession

Q4. A company installs a water-treatment plant for its workers' colony and opens a training centre that recruits youth from disadvantaged groups. These actions belong to:

(A) organisational objectives
(B) personal objectives
(C) social objectives
(D) efficiency objectives

Q5. "Management principles are flexible and not as exact as the principles of physics." This statement describes management as:

(A) an exact science
(B) an inexact or social science
(C) a full profession
(D) pure art and not science at all

Q6. Two managers apply the same motivation theory in identical departments, yet one achieves far better results because of her personal style. This shows management is:

(A) an exact science
(B) an art — personal skill and application differ from person to person
(C) a restricted profession
(D) only a group activity

Q7. Which level of management is responsible for interpreting the policies of the top level and converting them into departmental programmes?

(A) Supervisory level
(B) Top level
(C) Middle level
(D) Operative workers

Q8. A foreman in a textile factory who assigns daily tasks and checks the quality of cloth belongs to:

(A) the top level of management
(B) the middle level of management
(C) the supervisory (first-line) level of management
(D) no level — a foreman is a worker, not a manager

Q9. Which one statement about coordination and cooperation is correct?

(A) Cooperation is wider than coordination and includes it
(B) Coordination and cooperation are the same force
(C) Cooperation alone is not enough; coordination is deliberate synchronisation and is wider than cooperation
(D) Coordination is needed only at the top level of management

Q10. Controlling is closely linked to planning because:

(A) controlling replaces planning once work starts
(B) controlling compares actual performance with the standards that planning has set
(C) planning is done by the top level only, controlling by the supervisory level only
(D) both are performed only by the middle level

Solutions

Sol. Q1. The order was completed on time, so the **goal was achieved** — effectiveness is present. But overtime cost far exceeded the competitor's, so the goal was **not reached at minimum cost** — efficiency is missing. Effectiveness is about the end; efficiency is about the means.

Answer: (A)

Sol. Q2. An intangible force is one that cannot be **seen** but whose presence is **felt** — through orderly work, disciplined employees and targets being met. You recognise management by its results: where management is absent, you see confusion instead.

Answer: (B)

Sol. Q3. Management is multidimensional — it manages **work** (translating purpose into targets), **people** (employees, customers, suppliers) and **operations** (the production process turning input into output). The other options list functions, levels and the science-art-profession debate.

Answer: (B)

Sol. Q4. A water-treatment plant and recruitment of disadvantaged groups serve **society** and the community beyond the firm's own profit — social objectives. Organisational objectives are survival, profit and growth; personal objectives concern individual employees' salary, recognition and growth.

Answer: (C)

Sol. Q5. Management deals with human beings whose behaviour cannot be predicted with laboratory precision — the same policy can succeed in one city and fail in another. Hence management is an **inexact (social) science**: systematised knowledge, but flexible principles.

Answer: (B)

Sol. Q6. The same theory, different personal results — that is the signature of **art**: practical knowledge, personal skill, creativity and perfection through practice. Each manager applies shared knowledge in a personal style.

Answer: (B)

Sol. Q7. Interpreting top-level policies for a department is the defining job of the **middle level** — divisional and departmental heads. They link the top and the supervisory levels, passing orders down and reports up.

Answer: (C)

Sol. Q8. Assigning daily tasks and checking day-to-day output quality is supervisory-level work — the foreman is the **first-line** manager whom workers meet daily. He is a manager (he gets work done through others), not a worker.

Answer: (C)

Sol. Q9. Cooperation is voluntary willingness to help; coordination is the **deliberate** synchronisation of group efforts and is **wider** — it includes cooperation but adds direction and timing. Hard rowing without timing leaves the boat spinning, so cooperation alone is not enough.

Answer: (C)

Sol. Q10. Controlling means measuring actual performance against the **standards set during planning** and correcting deviations — planning without controlling is blind, controlling without planning is groundless. The two functions form a continuous loop.

Answer: (B)
